

Preconditions and boundary conditions across capacity markets; ERCOT is the design comparator

Market	Admissibility gate		Recovery basis
Ireland/SEM (2029/30)	connection mandate (capacity agreement)	DCs: 22% of metered electricity (2024, CSO)	SOCIALIZED preconditions present
PJM	firm forecast gate (CIFP, 70% derate)		SOCIALIZED preconditions present
GB (T-4 2029/30)	prequalification (T-4 rules)		SOCIALIZED preconditions present
ISO-NE	gate forming (large-load forecast)		SOCIALIZED preconditions present
Italy (Terna)	feasibility screen (prequalification)	DCs: 3% of demand (2030 projection)	SOCIALIZED preconditions present
MISO	41% attrition screen (LTLF model)		SEASONAL summer socialized; fall local
ERCOT	no capacity obligation (energy-only)		ENERGY-ONLY design comparator

PJM is quantified. MISO is the seasonal boundary test: uniform summer clearing supports the mechanism, while constrained fall clearing localizes it. Other markets are precondition checks.
