

The concentration-socialization mechanism recurs across six capacity markets; ERCOT (energy-only) is the negative control			
Market	Admissibility gate		Cost recovery
Ireland/SEM (2029/30)	connection mandate (mandatory agreement)	data centres 22% of national metered electricity (2024, CSO)	SOCIALIZED <i>mechanism ON</i>
PJM	firm forecast gate (CIFP, 70% derate, 3-yr fwd)		SOCIALIZED <i>mechanism ON</i>
GB (T-4 2029/30)	prequalification (T-4 Capacity Market rules)		SOCIALIZED <i>mechanism ON</i>
ISO-NE	gate forming (inaugural LLF, 2026)		SOCIALIZED <i>mechanism ON</i>
Italy (Terna)	feasibility screen (Terna prequalification)	data centres 3% of demand (proj. 2030)	SOCIALIZED <i>mechanism ON</i>
MISO	41% attrition screen (LTLF attrition model)	data centres 20% of demand (proj. 2030)	LOCATIONAL <i>mechanism OFF (boundary condition)</i>
ERCOT	no capacity obligation (energy-only; locational energy costs)		ENERGY-ONLY <i>no capacity market (negative control)</i>

All six capacity markets use sloped administrative demand curves. Recovery basis drives mechanism presence; MISO localizes (boundary condition); ERCOT energy-only is the negative control. Price levels not equated (Methods).
