

Preconditions and boundary conditions across capacity markets; ERCOT is the negative control

Market	Admissibility gate	Recovery basis
Ireland/SEM (2029/30)	connection mandate (capacity agreement)	data centres 22% of national metered electricity (2024, CSO) SOCIALIZED preconditions present
PJM	firm forecast gate (CIFP, 70% derate)	SOCIALIZED preconditions present
GB (T-4 2029/30)	prequalification (T-4 rules)	SOCIALIZED preconditions present
ISO-NE	gate forming (large-load forecast)	SOCIALIZED preconditions present
Italy (Terna)	feasibility screen (prequalification)	data centres 3% of demand (2030 projection) SOCIALIZED preconditions present
MISO	41% attrition screen (LTLF model)	SEASONAL summer socialized; fall local
ERCOT	no capacity obligation (energy-only)	ENERGY-ONLY negative control

PJM is quantified. MISO is the seasonal boundary test: uniform summer clearing supports the mechanism, while constrained fall clearing localizes it. Other markets are precondition checks.
